

Product Data

Product: Human Female Metaphase Slides
Catalog #: HFM
Source: Human Female Lymphocytes
Storage: -20°C

Description:

Human Female Metaphase Slides are prepared using standard cytogenetic slide preparation methods. They are prepared from karyotypically normal female PHA-stimulated peripheral blood lymphocytes that are cultured for approximately 72 hours, synchronized, and then cultured for an additional 5-7 hours before continuing with a standard chromosome harvest protocol. Slides produced are ideal for various FISH protocols, including probe verification and CGH.

How Supplied:

Human Metaphase Slides are supplied in units of 5 and are ready to hybridize. Each slide can accommodate two 22mm² hybridization areas, for a total of 10 hybridization areas per unit. Store @ -20°C.

Quality Control Assay:

Slides from each lot are stained and examined for the presence of metaphase spreads. Metaphases are examined to ensure all chromosomes are present, there are no abnormalities and chromosomes have a consistent length of 400-550 bands. Slides are also examined for optimal metaphase spreading, low surrounding cytoplasm and a high mitotic index. Each 22mm² hybridization area contains at least 20 high-quality spreads.
